Summary of Data

Below is a list of Kennel Club registered Finnish Lapphunds, the majority of which were provided by the KC on 9th Nov. 09, giving the date that they were last examined under the BVA/KC/ISDS Eye Scheme, the result of that examination and their sire and dam. Each dog is found to be either unaffected by the eye condition known to be inherited in that breed, or affected by the condition indicated. All dogs used for breeding must have a current Eye Test Certificate - they are valid for one year.

The BVA states that it must be emphasised that some dogs will develop non-congenital inherited eye diseases when older, so re-examination is essential for the establishment of clear breeding lines.

Excluded from the data are Litter Screening Eye Examinations and test results from older dogs, some of which are held in the Breed Archive of the Finnish Lapphund Club of Great Britain. The Eye Examination certificate is valid for one year and if the dog has a current certificate then any earlier results are excluded. The owner of the dog may have a more up-to-date certificate than the one recorded here.

The Kennel Club BVA/KC/ISDS Eye Scheme results for Finnish Lapphunds only include the Schedule A condition: GPRA (General Progressive Rod Atrophy). Other results on the Test Certificate (e.g. HC, PHPV, PPM, MRD) are not recorded by the KC and members are therefore advised to inspect the originals.

If you have any questions or want copies of current or older test results and certificates (if available), then please contact the Breed Health Co-ordinator at health@finnishlapphund-club.co.uk.

Key to the Results

GPRA Result Schedule A: Either Affected or Unaffected by General Progressive Retinal Atrophy. The Eye Examination must be carried out every year for a dog used for breeding. It is an important test to show if a dog is affected by eye conditions such as cataracts or PRA.

prcdPRA Result: Either Clear, Carrier or Affected. Genetic testing used in informed breeding programs is essential for preventing new cases of vision loss. See table below for explanations. This is a gene test that is done once in the lifetime of the dog. It became available from a USA company, Optigen on 1st Dec. 2005.

	If the cell is clear then the data is recorded on the Kennel Club databases. See Summary of Data above for what is and isn't recorded. See the FLC of GB website (Health) for how to get your data data onto the database.
	This colour is used to indicate that the Optigen prcdPRA test result is not held on the Kennel Club database when checks were made on the data as at 9th Nov 09. If there is a result with a date then the prcd test result is held in the Finnish Lapphund Club of GB Breed Archive database and is available to view from the FLC of GB Health Co-ordinator. This usually applies to tests that were done prior to 4th September 2007, when the Kennel Club started getting the test results directly from Optigen, without going through the owner. If there is a result without a date, then no Optigen Test certificate is recorded by the KC or the Finnish Lapphund Club of GB. If your dog's test results are not recorded then please send in the results to the KC and Breed Health Co-ordinator, to get the KC and Breed Archive up-to-date - see the club website for details.
	Marker Test Results: this colour is used to show gene marker tests which were carried out by the Clinical Veterinary Medicine Department at Cambridge University. They are <u>only 90%</u> accurate. These tests helped to develop the prcdPRA gene test for Finnish Lapphunds and were done before the Optigen test became commercially available on 1st Dec. 2005.
	Early prcdPRA Results from Optigen. These tests were carried out in conjunction with the gene Marker Tests, (see above), as part of the research programme to create the prcdPRA gene test. Because they were done before the gene test was commercially available there is no formal certificate. The results were sent to the Finnish Lapphund Club of Great Britain and are reproduced here. Not all Marker Test results were confirmed by gene tests.

REGN. NO. In most cases this is the Kennel Club Registration Number unless the country is listed in brackets after the number. The list also includes some dogs which do not have a KC Registration Number. These are dogs resident overseas. If a dog is imported, the KC require a three generation pedigree for that dog. So whilst the imported dog will have a KC Registration Number, the remaining 14 dogs will not have a KC number but will still appear on the KC database.

Key to prcd-PRA DNA Test Terminology and Notes on Results

Optigen Test Result Term	Kennel Club Equivalent Result Term	Risk of developing prcd-PRA* (from Optigen)
Normal / Clear	Clear	This dog will never develop the prcdPRA form of PRA (progressive rod cone degeneration form of Progressive Retinal Atrophy).
N/A	prcdPRA Hereditary Clear This result is deduced by the Kennel Club using their database system, based on the Optigen test results of both the parents of the dog being CLEAR.	This dog will never develop the prcdPRA form of PRA (progressive rod cone degeneration form of Progressive Retinal Atrophy).
Carrier	Carrier	This dog will never develop the prcdPRA form of PRA (progressive rod cone degeneration form of Progressive Retinal Atrophy). <i>See Code of Ethics for significance for breeding (on next page).</i>
Affected	Affected	Very high risk of developing the prcdPRA form of PRA. The dog has the genetic make-up that causes the prcd form of PRA (progressive rod-cone degeneration form of Progressive Retinal Atrophy). All dogs with the Affected genotype eventually will develop prcd-PRA if they live long enough. Known cases of extremely late onset of PRA indicate that some Affected dogs might not be diagnosed with PRA in their lifetime. <i>See Code of Ethics for significance for breeding (on next page).</i>

Note to Table: Risk of Developing prcdPRA*

Optigen has reported finding a few Finnish Lapphunds which are not "Affected" according to the genetic test for prcd-PRA but unfortunately have been diagnosed with PRA following a clinical examination e.g. the KC/BVA/ISDS Eye Examination. Possible reasons are:

- If the clinical condition has a different cause then the Optigen test will not detect it.
- The PRA may have been caused by other mutations, other genes, or non-genetic factors that result in a disease that looks similar on eye examination. This means that a dog could have an Optigen gene test showing Normal or Carrier for prcd-PRA, yet be affected by a different type of PRA. Optigen has stated that unfortunately there are at least two forms of PRA in the breed and only one is detectable with their current DNA tests (2nd Nov 2009).

In the data, there are occasions where the BVA/KC/ISDS test shows UNAFFECTED but the prcdPRA gene test shows that the dog is Affected. The gene test is the correct result. The dog may develop prcdPRA late in it's life. The prcdPRA therefore does not show up in a clinical eye examination in the dog's earlier years.

Because of these results, the Finnish Lapphund Club of Great Britain, insists in the Code of Ethics, that breeders must do both the annual clinical eye examination to check for PRA and other eye conditions, as well as the one-off gene test.

Extract from Code of Ethics: Finnish Lapphund Club of Great Britain

[Download the full Code of Ethics here](#)

These are mandatory breeding rules for members of the Finnish Lapphund Club of Great Britain, to prevent any new cases of vision loss. They cover tests and how to use the results in breeding decisions.

Extract from BREEDING section:

17. Each breeder shall plan each mating with the paramount intention of maintaining the Breed Standard and shall only breed when he is in a position to give proper care to both the bitch and offspring.

Members should follow these guidelines in regard to DNA testing and prcdPRA status.

- a) All breeding stock must be DNA tested for prcdPRA before being used in a mating programme, except where gene status is identified by parentage i.e. the progeny of two DNA tested clear dogs can be assumed to be clear and the progeny of DNA tested clear to affected matings can be assumed to be carriers.
- b) Identified carriers must only be mated to genetically clear dogs.
- c) Carriers can be mated to a DNA tested clear dog/bitch. If this is done, the progeny of such a mating must be DNA tested to identify the carrier and clear progeny. All untested progeny from such a mating must be endorsed `progeny not eligible for registration`. Such endorsements to be lifted only after the dog/bitch has been DNA tested.
- d) Affected dogs must only be mated to a DNA tested clear dogs; all progeny must be endorsed `progeny not eligible for registration`. These endorsements to be lifted only if the dog is to be mated to a DNA tested clear dog.

18. Each breeder shall select sire and dam with regard to health and temperament after a careful study of the Breed Standard, the relevant pedigrees and the basic principles of genetics. Each stud dog owner shall similarly consider these matters when contracting for the use of his dog.

19. Each breeder shall safeguard his bitches from unsuitable matings.

20. Breeders shall breed only from stock that is free from known hereditary defects. On no account shall an animal of unsuitable temperament be bred from. If an animal is born with any defect or subsequently develops an inherited condition, the full details shall be made available to the Breed Archive Secretary.

21. All stock prior to mating must be DNA prcdPRA tested except where the gene status is identified by parentage; eye tested for hereditary cataracts (HC), progressive retinal atrophy (PRA) under the BVA/KC or ECVO Scheme, i.e. a current annual eye certificate must be held prior to mating, and be examined under the BVA/KC Scheme for the control of Hip Dysplasia. Copies of the results should be made available to the Breed Archive Secretary and these may be made publicly available.

Extract from SALES section:

25. The breeder shall arrange for the Kennel Club Registration and a signed Transfer form to be sent to the purchaser with the least possible delay. The Registration should be endorsed `Progeny not for Registration` - and this made clear to the purchasers prior to the sale. The breeder should only lift this endorsement once the dog has been tested as in (21) above. A puppy may be sold without registration and transfer papers if that is understood and agreed to in writing by both parties.
